

**Writeup for the SQL Project:**

I have implemented queries based on the Employee data tables, by following the steps below:

1. Created schema named Project SQL
2. Created the tables in the query by naming and specifying the fields and their data type, i.e., VARCHAR, INT, DECIMAL etc.
3. After this I Tried uploading the data from the CSV files via queries, using DATA LOAD etc. as can be seen in the Queries code PDF attached.
4. I simplified the process of running queries by converting them into steps as follows. The same descriptions can be seen as the comments in the code I have attached.
  1. MAX salary of the employees
  2. Calculating the bonuses
  3. Reports for the employee data and their performances
    1. Employee performance mapping
    2. Projects of the respective employees
    3. Details from the data science team
    4. Employee performances pulled from the data science team
    5. Projects under data science team

**Please Note:**

Along with the given queries for execution, there are additional queries in the file that I had implemented before finding the original questions on my LMS.
